

Question:

A sales dataset is prepared manually by multiple teams and shows the following problems:

- Inconsistent product names due to spacing, casing, and spelling differences
- Multiple columns contain merged text values (e.g., Region_Product_Code)
- Duplicate records exist, but removing them incorrectly affects totals
- Some numeric fields contain text and extra symbols
- The final report requires **filtered summary statistics (mean and standard deviation)** for only valid records

Describe **the end-to-end approach** you would use in Excel to **clean, standardize, split, validate, and analyze** this dataset.

Explain **how you would prevent future data issues** and ensure the results remain **accurate when new data is added**.
